# Genetic Interaction Network

- Number of vertices: 2803
- Number of edges: 67,268

# Preliminaries

**Network:** abstraction of  
*entities* and their interactions

**Graph:** mathematical  
representation

*vertices:* nodes

*edges:* links

Undirected graph

# Preliminaries

**Network:** abstraction of  
*entities* and their interactions

**Graph:** mathematical  
representation

*vertices*: nodes

*edges*: links

Directed graph

# Network statistics: notation

Number of vertices:  $n$

In our example: *number of genes*

# Network statistics: notation

Number of vertices:  $n$

In our example: *number of genes*

Number of edges:  $m$

In our example: *number of genetic interactions*

# Network statistics: notation

Number of vertices:  $n$

In our example: *number of genes*

Number of edges:  $m$

In our example: *number of genetic interactions*

Degree of vertex  $i$ :  $k_i$

*Number of genetic interactions for gene  $i$*

# Network statistics: notation

On the board:

- Calculate number of edges  $m$  using degrees  $k_i$  (for both directed and undirected networks)
- Calculate *average degree*  $c$
- Calculate *density*  $\rho$

# Network statistics: notation

On the board:

- Calculate number of edges  $m$  using degrees  $k_i$  (for both directed and undirected networks)
- Calculate *average degree*  $c$
- Calculate *density*  $\rho$

In our example:

Average degree: 47.9971459

Density: 0.0171296

(On the board)

Number of edges using degrees (undirected)

$$m = \frac{1}{2} \sum_{i=1}^n k_i$$

Number of edges using degrees (directed)

$$m = \sum_{i=1}^n k_i^{\text{in}} = \sum_{i=1}^n k_i^{\text{out}}$$

(On the board)

Average degree

$$c = \frac{1}{n} \sum_{i=1}^n k_i$$

Density

$$\rho = \frac{m}{\binom{n}{2}} = \frac{2m}{n(n-1)} = \frac{c}{n-1} \approx \frac{c}{n}$$

# Degree distribution

Fundamental analytical tool to characterize networks

$p_k$ : probability randomly chosen vertex has degree  $k$

On the board: how to calculate  $p_k$  and how to calculate average degree  $c$  using degree distribution.

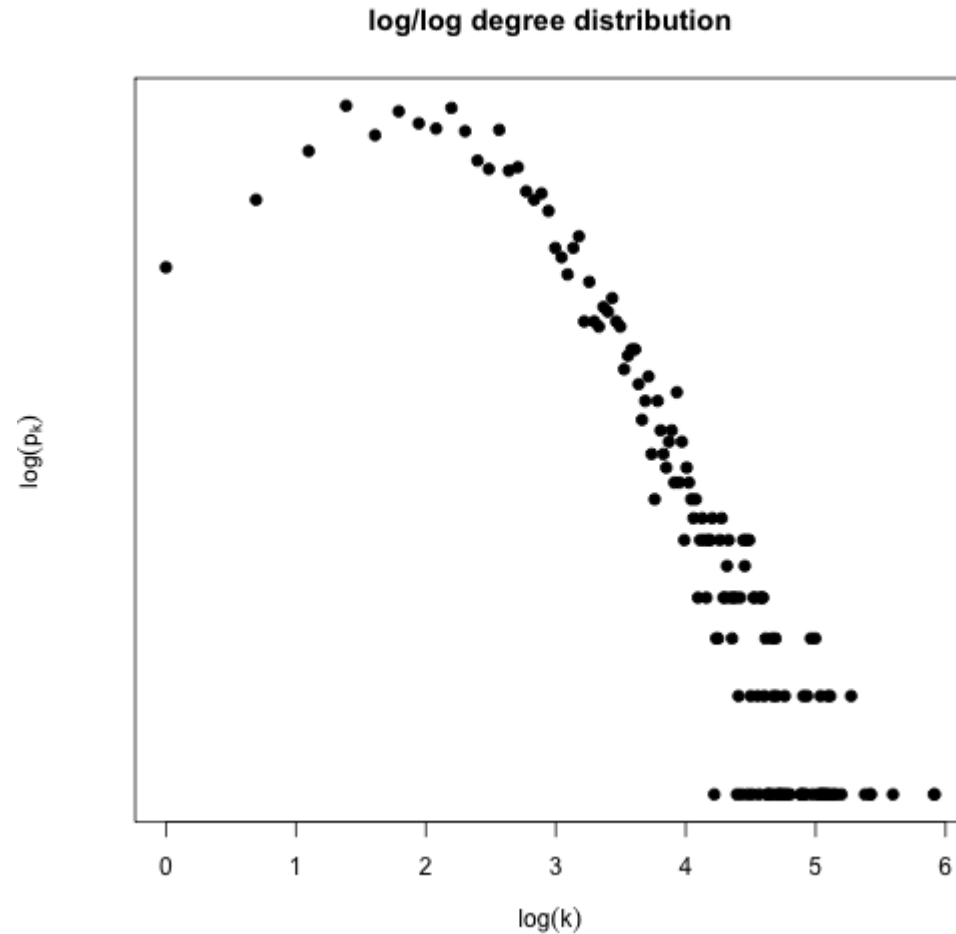

(On the board)

Degree distribution

$$p_k = \frac{n_k}{n}$$

$n_k$ : number of nodes in graph with degree  $k$

# Degree Distribution

# Paths and Distances

*Distance  $d_{ij}$* : length of **shortest** path between vertices  $i$  and  $j$ .

# Paths and Distances

*Distance  $d_{ij}$* : length of **shortest** path between vertices  $i$  and  $j$ .

*Diameter*: longest shortest path  $\max_{ij} d_{ij}$

# Paths and Distances

*Distance  $d_{ij}$* : length of **shortest** path between vertices  $i$  and  $j$ .

On the board: average path length

(On the board)

Average path length

$$\bar{d} = \frac{1}{n(n-1)} \sum_{i,j; i \neq j} d_{ij}$$

# Distance Distribution

# Distances and paths

By convention: if there is no path between vertices  $i$  and  $j$  then  $d_{ij} = \infty$

# Distances and paths

By convention: if there is no path between vertices  $i$  and  $j$  then  $d_{ij} = \infty$

*Vertices  $i$  and  $j$  are connected if  $d_{ij} < \infty$*

# Distances and paths

By convention: if there is no path between vertices  $i$  and  $j$  then  $d_{ij} = \infty$

*Vertices  $i$  and  $j$  are connected if  $d_{ij} < \infty$*

*Graph is connected if  $d_{ij} < \infty$  for all  $i, j$*

# Distances and paths

By convention: if there is no path between vertices  $i$  and  $j$  then  $d_{ij} = \infty$

*Vertices  $i$  and  $j$  are connected* if  $d_{ij} < \infty$

*Graph* is connected if  $d_{ij} < \infty$  for all  $i, j$

*Components* maximal subset of connected components

# Components

# Clustering Coefficient

Another quantity of interest: how dense is the neighborhood around vertex  $i$ ?

Do the genes that interact with me also interact with each other?

Related to the *locality* property.

Definition on the board

(On the board)

Clustering coefficient

$$c_i = \frac{2m_i}{k_i(k_i - 1)}$$

$m_i$ : number of edges between neighbors of vertex  $i$

# Clustering coefficient

# Adjacency Matrix

Undirected graph

# Adjacency Matrix

On the board:

- Definition
- Computing degree with adj. matrix
- Computing num. edges  $m$  with adj. matrix
- Computing paths with adj. matrix

# Adjacency Matrix

Directed graph

# Weighted networks

Edges are assigned a weight indicating quantitative property of interaction

# Weighted networks

Edges are assigned a weight indicating quantitative property of interaction

- Strength of genetic interaction (evidence from experiment)
- Rates in a metabolic network
- Spatial distance in an ecological network

Adjacency matrix contains weights instead of 0/1 entries

Adjacency matrix contains weights instead of 0/1 entries

Path lengths are the sum of edge weights in a path

# Hypergraphs

Edges connect more than two vertices

**A** Protein-protein interaction network

$$C_1 = \{A, B, C, D\}$$

$$C_2 = \{A, E\}$$

$$C_3 = \{C, E\}$$

Hypergraph

Graph

<https://journals.plos.org/ploscompbiol/article?id=10.1371/journal.pcbi.1000385>

# Trees

*Acyclic graphs*

Single path between any pair of vertices

# Bipartite Networks

## C Reaction networks

$$\begin{array}{c} A \\ B \\ C \\ D \\ E \end{array} \begin{pmatrix} R_1 & R_2 & R_3 \\ -1 & -1 & 0 \\ 1 & -1 & 0 \\ 0 & 1 & 0 \\ 0 & 1 & -1 \\ 0 & 0 & 1 \end{pmatrix} \begin{array}{l} \text{Stoichiometric} \\ \text{matrix} \end{array}$$

# Bipartite Networks

We use an *Incidence Matrix*  $B$  instead of *Adjacency Matrix*

(On the board): definition

# Bipartite Networks

## Projections

*vertex projection*:  $P_{ij}$ , num. of groups in which vertices  $i$  and  $j$  co-occur

*group projection*:  $P'_{ij}$ , num. of members groups  $i$  and  $j$  share

# Bipartite Networks

## Projections

*vertex projection*:  $P_{ij}$ , num. of groups in which vertices  $i$  and  $j$  co-occur

*group projection*:  $P'_{ij}$ , num. of members groups  $i$  and  $j$  share

(On the board)

$$P = B^T B$$

$$P' = B B^T$$

# Centrality

What are the *important* nodes in the network?

What are *central* nodes in the network?

# Centrality

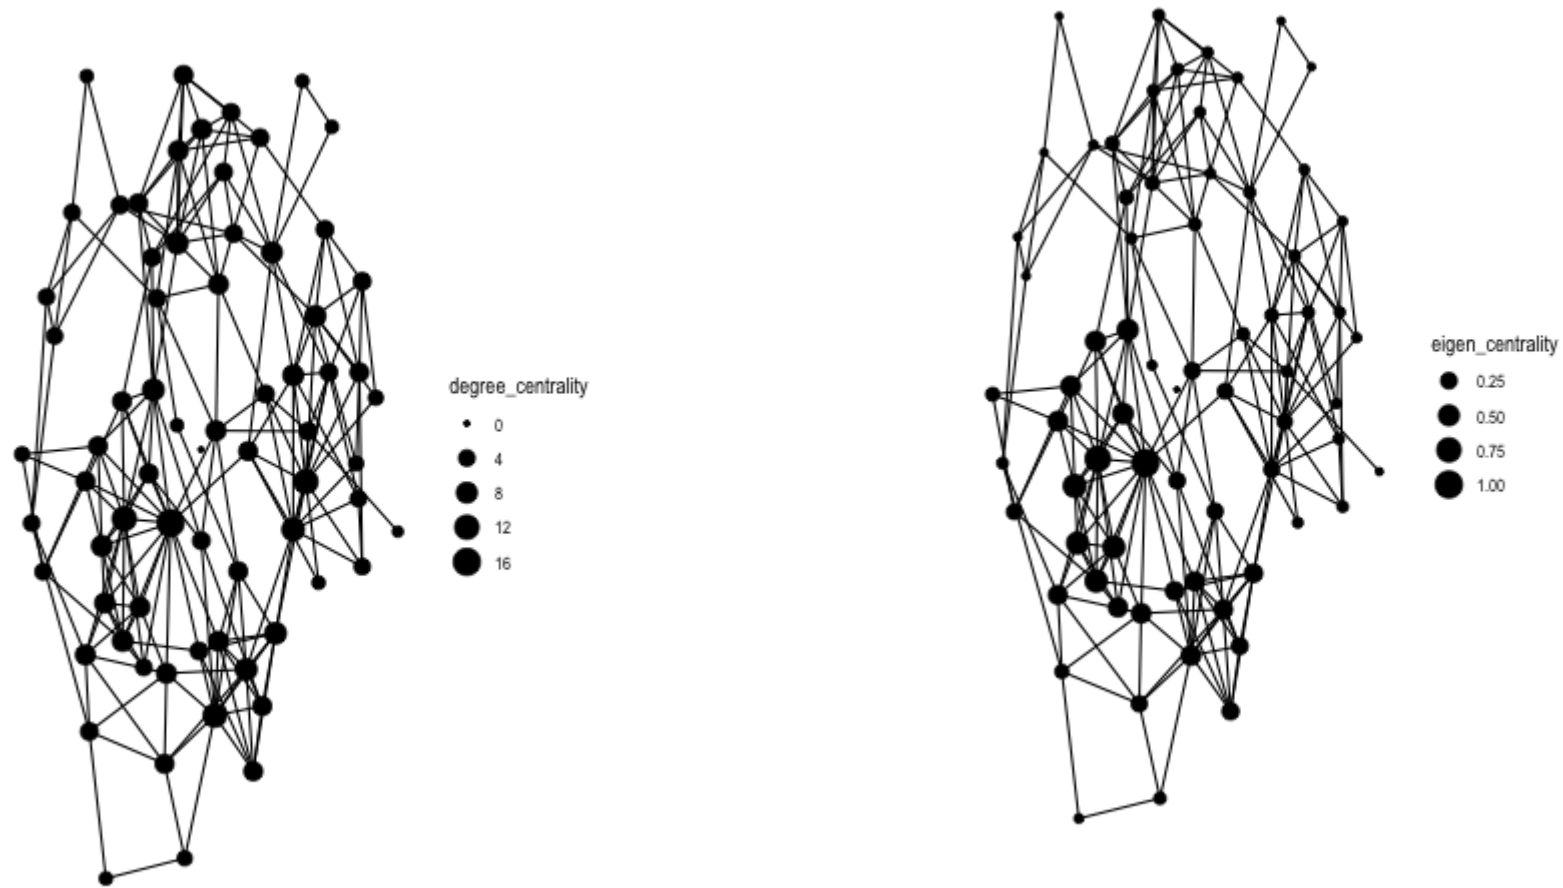

## Undirected Graphs

- Eigenvalue Centrality

## Directed Graphs

- Katz Centrality
- Pagerank

# Centrality

# Betweenness

What are the *important* edges in the network?

What are edges that may connect clusters of nodes in the network?

# Betweenness

Girvan-Newman Algorithm -  
hierarchical method to  
partition nodes into  
communities using edge  
betweenness

# Girvan-Newman Algorithm

Two phases:

Phase One: Compute betweenness for every edge

Phase Two: Discover communities by removing *high* betweenness edges (similar to hierarchical clustering)

# Girvan-Newman Algorithm

## Calculating Betweenness

Formally,  $\text{betweenness}(e)$ : fraction of node pairs  $(x, y)$  where shortest path crosses edge  $e$

For each node  $x$ , use breadth-first-search to count number of shortest paths through each edge in graph

Sum result across nodes, and divide by two

# Girvan-Newman Algorithm

Example
